lab4_all_tasks (1).p...
Document

game (1).py
Code

Before the walkthrough, I'm checking one thing. Barrels may take too long to reach the player for a 10-second video to show all four tasks, so I'm timing them.
Here is the full walkthrough, start to finish.
Two changes since my last message:

- I timed the barrels. A barrel takes about 5 seconds to reach the second platform up and about 10 seconds to reach the first, so a strict 10-second clip can't show barrel jumps. I lowered two thresholds so everything shows up sooner. Task 2 now uses `score / 400` (was 800) and Task 4 now kicks in at `score >= 200` (was 500). Use the numbers below, not the earlier ones. The `game.py` and patch files on this reply are updated to match.
- The instructor's forwarded note says every task must be clearly visible in the video. That matters more than the 10-second length, so record 20–30 seconds if you need to.

Part A: Set up your own repo

1. On GitHub (your personal account), create a new **public** repo, e.g. `lab-repo` . Tick "Add a README".
2. Clone it:

bash

```
Bash

    git clone https://github.com/<your-username>/lab-r
```

3. Clone the assigned repo somewhere else, just to copy the original files:

bash

```
Bash

    git clone https://github.com/SETAPESU26/30_donkeyk
```

4. In your repo, make the folder and copy the original files in:

bash

```
Bash

    cd lab-repo
    mkdir Lab-4
    cp ../30_donkeykong/game.py ../30_donkeykong/READM
    git add Lab-4
    git commit -m "Add original Donkey Kong code (befc
```

On Windows PowerShell, use `copy` instead of `cp`.

Part B: Record the “before” video

5. Run the game:

bash

```
Bash

    pip install pygame
    cd Lab-4
    python game.py
```

6. Start a screen recorder: `Win+G` (Xbox Game Bar) on Windows, `Cmd+Shift+5` on Mac, or OBS.
7. Record about 10 seconds with the barrels rolling. You should see almost every barrel take the first ladder, the lower platforms flooding, and the top platform emptying.
8. Save it as `before.mp4` in `Lab-4/`. Then:

bash

```
Bash

    git add before.mp4
    git commit -m "Add before video"
```

Part C: Apply the four tasks (one commit each)

Open `Lab-4/game.py` in your editor.

Task 1: fix the bug.

Ctrl+F: `if random.random() < 0.7:`

Change `0.7` to `0.3`.

bash

```bash
git commit -am "Task 1: fix barrel ladder-descent pro
```

Task 2: `theme_color`.

Ctrl+F: `Return an (r, g, b) background colour`

Delete the `pass` on the next line and put this in its place:

python

```python
    t = min(score / 400, 1.0)  # 0 at score 0, fully
    warm = (95, 35, 20)
    return tuple(int(BG[i] + (warm[i] - BG[i]) * t) f
```

bash

```bash
git commit -am "Task 2: implement theme_color"
```

Task 3: `on_barrel_jumped`.

Ctrl+F: `def on_barrel_jumped(player, barrel):`

Replace the whole function (`def`, docstring and `pass`) with:

python

```python
FLOATERS = []  # floating score labels: [x, y, spawn_
LAST_MULT = 1  # multiplier used for the most recent

def on_barrel_jumped(player, barrel):
```

```
    """Called when the player clears a barrel; add a
    FLOATERS.append([barrel.pos.x, barrel.pos.y - 20,
```

Then Ctrl+F: `hud = font.render(` . It is inside `draw_scene` . Paste this directly above it, with the same 4-space indent:
python

```python
    now = pygame.time.get_ticks()
    FLOATERS[:] = [f for f in FLOATERS if now - f[2]
    for fx, fy, born, text in FLOATERS:
        age = now - born
        label = font.render(text, True, (255, 255, 12
        label.set_alpha(255 - int(255 * age / 900))
        screen.blit(label, label.get_rect(center=(fx,
```

bash

```bash
git commit -am "Task 3: implement on_barrel_jumped"
```

Task 4: `score_multiplier` .
Ctrl+F: `Return a multiplier applied to points earned`
Delete the `pass` on the next line and put this in its place:
python

```python
    global LAST_MULT
    LAST_MULT = 2 if score >= 200 else 1
    return LAST_MULT if LAST_MULT > 1 else None
```

bash

```bash
git commit -am "Task 4: implement score_multiplier"
```

If you'd rather skip the copy-paste, copy my `game.py` over yours. You'd then be making one commit instead of four, so the patch file is the better shortcut. Run `git am ../lab4_all_tasks.patch` from inside your repo with the patch saved one folder up. Check that the patch applies to `Lab-4/game.py`, because the patch paths assume `game.py` is at the repo root.

Part D: Test before recording

9. Run `python game.py` and check:
    - Barrels take ladders about 3 times in 10.
    - The background drifts from navy to warm red as your score rises.
    - A "+100" label floats up and fades when you jump a barrel.
    - After 200 points, the label reads "+200" and the score jumps by 200.
10. If it crashes, paste the error to me.

Part E: Record the "after" video

11. Controls: arrows to move, Space to jump, Up/Down on a ladder.
12. The ladder at x=650 (right side) takes you from the bottom platform to the second one. Barrels reach that platform after about 10 seconds, so climb up and jump the barrels as they roll toward you.
13. Get at least 3 jumps in. Jumps 1 and 2 show "+100" and the background warming. Jump 3 shows "+200", which proves the multiplier works.
14. Keep the score and lives visible in the top-left. Also try to show a barrel taking a ladder, to demonstrate the bug fix.
15. Save it as `after.mp4` in `Lab-4/` and commit:

bash

```Bash
git add after.mp4
git commit -m "Add after video"
```

Part F: Export the chat as PDF

16. In this conversation, press `Ctrl+P` (`Cmd+P` on Mac) and choose **Save as PDF** as the destination.
17. Scroll to the top first so the whole chat loads, and check that the PDF has every message. Save it as `chat_history.pdf` in `Lab-4/`. The instructor said a PDF only, not a link.
18. Commit:

bash

```bash
git add chat_history.pdf
git commit -m "Add chat history"
```

Part G: Push and verify

19. Push:

bash

```bash
git push origin main
```

20. On GitHub, open `Lab-4/` and check that it contains `game.py`, `before.mp4`, `after.mp4` and `chat_history.pdf`. Also open the commit list and confirm the four separate task commits are there.
21. Don't open a PR to SETAPESU26.

Final checklist

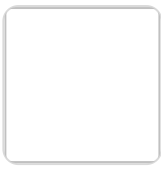

- Before video shows the barrel flooding
- After video shows the ladder fix, the colour change, "+100", and "+200"
- Four separate task commits are visible
- Chat history PDF (not a link)
- Everything is in `Lab-4/` of your own repo

You may be asked to explain these changes in a viva or demo, so skim the code once. The `random.random()` check, the colour blend and the multiplier are all short.
guide me through this step by step

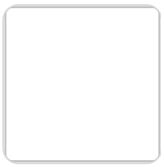

https://github.com/divyansh2162/lab-repo.git

this is exactly what i copied and my username is divyansh2162

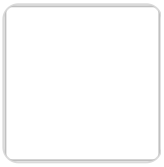

Worked for 9s

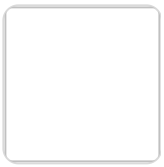

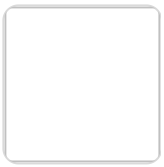

done

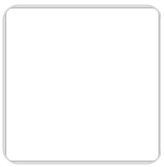

dint fully get this part

ive run the game but do i play or just let it run? score is till 0 , ir sbeen running for 30 seconds

yes it works
